• Height of barometer cistern above mean sea level = 152 feet (average correction to sea level + 5.6 mb.). In this table, numbers in parentheses signify that the numbers in the preceding column are above or below the average to which the signs are affixed.

† Density is expressed in millibars (1,000 mb. = 29.531 mercury inches).

‡ Density is expressed in grams per cubic metre (2.294 grams per cubic metre = 1 grain per cubic foot).

## APPENDIX B.1. CHANGES IN THE INTERNATIONAL LIST OF CAUSES OF DEATH.

Conversion Ratios for Separate Causes of Death (1940-49 classification) to be applied to figures tabulated in the Statistical Reviews of earlier years, in order to correct for the changes in the International List and in the method of classification when several causes are certified, which came into force in 1940. (See the Manual of the International List of Causes of Death, fifth decennial revision, 1938).

## GENERAL NOTES

- (1) Transfers from one group to another of diseases not numerically important or not separately enumerated in past years are not detailed in columns 1-3 but will be found in Appendix B.2 and B.3.
- (2) In column 3 :—Descriptions marked (a) refer to the lines used in Tables LX or LXIII of the Text of 1937 Review, and corresponding tables for 1938 and 1939 and for years prior to 1937 in which the requisite separation of sites was made.  
Groups marked (b) refer to the supplementary tabulation of accidental deaths (including "open verdict" deaths classed to No. 195) in Table 25 of the Statistical Reviews for 1931-39.
- (3) In column 4 A denotes years 1936 to 1939 inclusive; B 1939 only; C 1937 to 1939 inclusive; D 1936 to 1938 inclusive; E 1938 and 1939; F 1940 only.
- (4) All figures relating to years 1931 to 1940 inclusive in the present Review have been either (1) counted directly according to the new system of joint cause selection or (2) calculated by means of the conversion ratios or by other methods in special cases. The calculated deaths have for certain sub-groups and in certain years been further subjected to slight adjustments in order that they might aggregate to the more reliable estimates for the whole group, and for this reason use of the conversion ratios as given in this Appendix may be found in some instances to result in estimates differing very slightly from those given in Tables 6, 7, 8, 11, 12 of the present Review. (See also Note 5).  
In column 5 "a" denotes deaths or rates as shown in Tables 6, 7, 8, 11, 12, 25 of the Reviews for 1931-39 relating to years 1935 or earlier; "b" denotes deaths or rates in the same tables relating to years 1938 or earlier; "c" denotes deaths or rates in the same tables relating to years 1936 or earlier; "d" denotes deaths where separately shown for the sites mentioned in Tables LXII or LXIII of the Text of 1935 Review and corresponding tables for earlier years; "e" denotes deaths as shown in Tables LXXXIV or LXXXV of the Text of 1935 Review and corresponding tables for earlier years; "f" denotes deaths or rates as shown in Tables 6 or 7 of the Reviews for 1931-39 relating to years 1930 or earlier; "g" denotes deaths ascertainable from Table 21 of the Reviews for 1931-35; "h" denotes deaths as shown in Table LI of the Text of 1930 Review and corresponding tables for earlier years; "i" denotes deaths ascertainable from Table 25 of the Reviews for 1931-38; "j" denotes deaths ascertainable from Table 25 of the Reviews for 1931-35.
- (5) The Conversion ratios for *persons* in column 8 are for use only when the deaths or death-rates for the separate sexes are not available. When possible, the figures for each sex should be corrected separately and the resultant numbers added together to obtain the persons total. This has been done in estimating the persons rates in Table 7. For certain aggregates in common use (e.g. tuberculosis, syphilis and cancer of all sites) conversion ratios are given for convenience, but these are intended for use only when the constituent figures are not available. Unless the trend of mortality has been the same for each constituent the totals obtained by use of such ratios may differ slightly from the aggregate of the corrected figures of the constituent groups.
